

# TAKING SECURITY SERIOUSLY

---

**DR. PHILIPPE DE RYCK**

<https://PragmaticWebSecurity.com>

## We Take Your Privacy and Security. Seriously.

September 29, 2014

135 Comments

“Please note that [COMPANY NAME] takes the security of your personal data very seriously.” If you’ve been on the Internet for any length of time, chances are very good that you’ve received at least one breach notification email or letter that includes some version of this obligatory line. But as far as lines go, this one is about as convincing as the classic break-up line, “It’s not you, it’s me.”

# WHAT DOES IT MEAN TO TAKE SECURITY SERIOUSLY?

I am *Dr. Philippe De Ryck*

Founder of Pragmatic Web Security

Google Developer Expert

Auth0 Ambassador

SecAppDev organizer

I help developers with security

Hands-on in-depth security training

Advanced online security courses

Security advisory services

<https://pragmaticwebsecurity.com>

*Giving the browser a snippet of code mixed with data*

```
1 let data = "<p>" + review + "</p>"
2 document.getElementById("msg").innerHTML = data
```

innerHTML relies on the browser's code parser to handle the data

*A review submitted by a malicious user*

```
1 This restaurant is highly recommended. The food
2 is exquisite and the service is impeccable.
```

### *Giving the browser a snippet of code mixed with data*

```
1 let data = "<p>" + review + "</p>"
2 document.getElementById("msg").innerHTML = data
```

innerHTML relies on the browser's code parser to handle the data

### *Giving the browser code and data with context information*

```
1 let p = document.createElement("p")
2 p.textContent = review
3 document.getElementById("msg").appendChild(p)
```

Using the proper DOM APIs provides the browser with context, avoiding the confusion that leads to XSS

### *A review submitted by a malicious user*

```
1 This restaurant is highly recommended. The food
2 is exquisite and the service is impeccable.
```

## Appending a div with jQuery's append function

```
1 $("#reviews").append(`<p class="review">${review}</div>`);
```

The screenshot displays the jQuery API documentation for the `.append()` method. The left sidebar shows the navigation menu with categories like Ajax, Attributes, Callbacks Object, Core, CSS, Data, Deferred Object, Deprecated, Forms, Internals, Manipulation, and Miscellaneous. The main content area is titled `.append()` | jQuery API Document and includes a code example, a description of the method, and a list of additional notes. The code example shows how to append a new div to an existing one. The description explains that `.append()` can accept a string of HTML, an array of HTML strings, or DOM elements. The additional notes section highlights a security warning about XSS and mentions that jQuery doesn't officially support SVG. The examples section shows a simple HTML document structure with a paragraph to be appended.

**jQuery API Document: `.append()`**

**Code Example:**

```
3 existingdiv1 = document.getElementById( "foo" );
4
5 $( "body" ).append( $newdiv1, [ newdiv2, existingdiv1 ] );
```

**Description:**

Since `.append()` can accept any number of additional arguments, the same result can be achieved by passing in the three `<div>`s as three separate arguments, like so: `$( 'body' ).append( $newdiv1, newdiv2, existingdiv1 )`. The type and number of arguments will largely depend on how you collect the elements in your code.

**Additional Notes:**

- By design, any jQuery constructor or method that accepts an HTML string — `jQuery()`, `.append()`, `.after()`, etc. — can potentially execute code. This can occur by injection of script tags or use of HTML attributes that execute code (for example, `<img onload="">`). Do not use these methods to insert strings obtained from untrusted sources such as URL query parameters, cookies, or form inputs. Doing so can introduce cross-site-scripting (XSS) vulnerabilities. Remove or escape any user input before adding content to the document.
- jQuery doesn't officially support SVG. Using jQuery methods on SVG documents, unless explicitly documented for that method, might cause unexpected behaviors. Examples of methods that support SVG as of jQuery 3.0 are `addClass` and `removeClass`.

**Examples:**

Appends some HTML to all paragraphs.

```
1 <!doctype html>
2 <html lang="en">
3 <head>
4   <meta charset="utf-8">
5   <title>append demo</title>
6   <style>
7     p {
8       background: yellow;
9     }
10  </style>
11  <script src="https://code.jquery.com/jquery-1.10.2.js"></script>
12 </head>
13 <body>
14
15 <p>I would like to say: </p>
16
```

# UNDERSTAND YOUR LIBRARIES

*Libraries and frameworks are not always secure out of the box. Understanding how your library of choice handles security is crucial.*

One framework.  
Mobile & desktop.

[GET STARTED](#)

{ {myDirtyData} }

## An Angular template to combine data with HTML

```
1 <div>
2   <h3>{{ review.title }}</h3>
3   <p>{{ review.content }}</p>
4 </div>
```

By default, Angular escapes values embedded in a template before rendering them

## A review submitted by a malicious user

```
1 This restaurant is <b>highly recommended</b>. The
2 food is exquisite and the service is impeccable. <a
3 href="https://pics.example.com">Check out my story
4 here!</a>
```

## An Angular template to render user-provided HTML

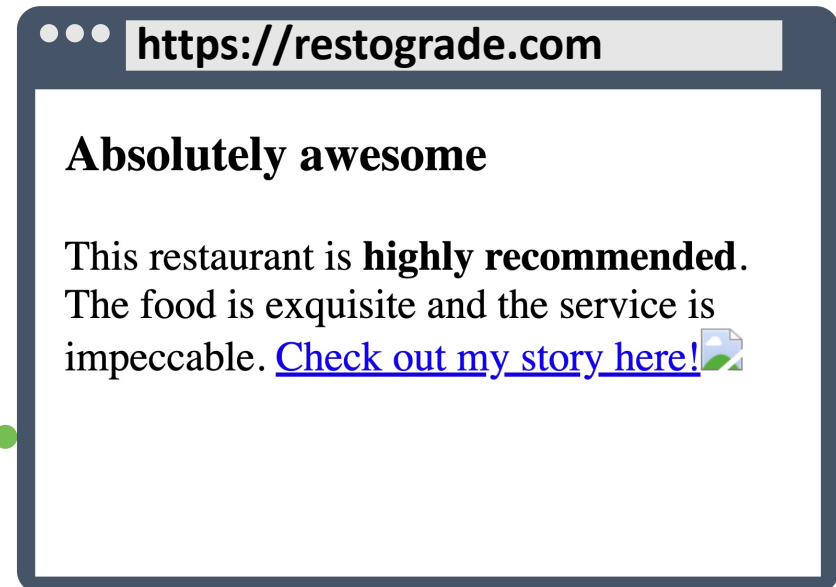

```
1 <div>
2   <h3>{{ review.title }}</h3>
3   <p [innerHTML]="review.content"></p>
4 </div>
```

`[innerHTML]` does not directly expose **innerHTML** property, but sanitizes the data first

## A review submitted by a malicious user

```
1 This restaurant is <b>highly recommended</b>. The
2 food is exquisite and the service is impeccable. <a
3 href="https://pics.example.com">Check out my story
4 here!</a>
```

Binding HTML into the page with Angular is secure by default

`trustAsHtml (myDirtyData)`

~~trustAsHtml (myDirtyData)~~

bypassSecurityTrustHtml (myDirtyData)

# MAKE INSECURITY EXPLICIT

*Explicitly marking features as insecure  
helps prevent accidental misuse  
and simplifies code scanning efforts*

*Data containing HTML with style attributes*

```
1 <p style="color: red">...</p>
```

The Angular sanitizer is secure-by-default and does not allow the use of *style* attributes

*The only way to allow style attributes is to bypass sanitization*

```
1 <div [innerHTML]="sanitizer.bypassSecurityTrustHtml(data)"></div>
```

This code completely disables the sanitizer, creating a massive vulnerability in the application

## An Angular pipe that sanitizes HTML but allows style information in attributes

```
1  @Pipe({
2    name: 'sanitizeWithStyle'
3  })
4  export class SanitizeWithStylePipe implements PipeTransform {
5
6    constructor(private sanitizer : DomSanitizer) {}
7
8    transform(html: string) : SafeHtml {
9      // Allowing CSS is still not recommended
10     return this.sanitizer.bypassSecurityTrustHtml(
11       DOMPurify.sanitize(html, {ADD_ATTR: ['style']}));
12   }
13 }
```

DOMPurify sanitizes the data, but is configured to allow *style* attributes

This use of *bypassSecurityTrustHtml* can be marked as checked, so code scanning tools ignore it

The application code no longer calls *bypassSecurityTrustHtml* directly

```
1  <div [innerHTML]="data | sanitizeWithStyle"></div>
```

Allowing style information can still result in attacks, so use a pattern like this with care

# SETUP DEVELOPERS FOR SECURITY SUCCESS

*Secure-by-default frameworks reduce the need for knowledge*

*Subtle security nudges reduce the risk of mistakes*

*Encapsulate dangerous functions and use linting to prevent direct usage*

*A typical DOM-based XSS vulnerability, which also occurs in many script gadgets*

```
1 document.querySelector("#data").innerHTML = "<b>Hello world!</b>" + data;
```

Providing data and code to the browser's HTML parser triggers DOM-based XSS

*A page enabling a Trusted Types policy in a response header*

```
1 Content-Security-Policy: require-trusted-types-for 'script'  
2  
3 document.querySelector("#data").innerHTML = "<b>Hello world!</b>" + data;
```

Enabling Trusted Types eliminates an entire class of XSS vulnerabilities

When *Trusted Types* is enabled, text-to-code sinks like *innerHTML* throw a *TypeError*

*Trusted Types does not affect the use of proper DOM APIs*

---

```
1 Content-Security-Policy: require-trusted-types-for 'script'
2
3 let msg = document.createElement("span");
4 msg.setAttribute("class", "italic");
5 msg.innerText = e.data;
6 document.getElementById("msg").appendChild(msg);
```

---

*innerHTML can still be used, as long as it is assigned a Trusted Type value*

---

```
1 Content-Security-Policy: require-trusted-types-for 'script'
2
3 let safeData = DOMPurify.sanitize("<b>Hello world!</b>" + data, {RETURN_TRUSTED_TYPE: true});
4 document.querySelector("#data").innerHTML = safeData;
```

---

The safe value can now be assigned to *innerHTML*, because it is properly sanitized by DOMPurify

DOMPurify has built-in support for *Trusted Types*, and can be instructed to return the data as a *TrustedHTML* value instead of a string

# Trusted Types for DOM manipulation

📄 - UNOFF

Usage

% of all users

Global

70.93%

An API that forces developers to be very explicit about their use of powerful DOM-injection APIs. Can greatly improve security against XSS attacks.

Current aligned

		93-94	94-96	15-TP				

*Enable trusted types by setting a CSP policy*

1 `Content-Security-Policy: trusted-types angular; require-trusted-types-for 'script'`

*The browser now refuses to assign unsafe content to innerHTML*

1 `this.div.nativeElement.innerHTML = this.inputValue;`

```
✖ ▶ Uncaught TypeError: Failed to set the index.js:1
'innerHTML' property on 'Element': This document
requires 'TrustedHTML' assignment.
    at HTMLIFrameElement.e.onload (index.js:1)
    at fe (index.js:1)
    at index.js:1
    at index.js:1
```

*Enable trusted types by setting a CSP policy*

```
1 Content-Security-Policy:  
2   trusted-types angular angular#unsafe-bypass; require-trusted-types-for 'script'
```

Enable Angular's built-in Trusted Types policy

Allow the use of `bypassSecurityTrustHtml`, secure or not

*The browser still refuses to assign unsafe content to innerHTML*

```
1 this.div.nativeElement.innerHTML = this.inputValue;
```

```
✖ ▶ Uncaught TypeError: Failed to set the index.js:1  
  'innerHTML' property on 'Element': This document  
  requires 'TrustedHTML' assignment.  
    at HTMLIFrameElement.e.onload (index.js:1)  
    at fe (index.js:1)  
    at index.js:1  
    at index.js:1
```

# USE PLATFORM-LEVEL SECURITY FEATURES

*Building applications on a secure platform offers a significant advantage*

*Trusted Types prevents dangerous DOM manipulations that lead to XSS*

*A secure platform not only covers the application, but also its dependencies*

> 97%

of code in a modern web app are dependencies

```

# Snyk for Developers & DevOps

Snyk continuously monitors your application's dependencies and lets you quickly respond when new vulnerabilities are disclosed.

## Fix your vulnerabilities

- ✓ Single click fix - generate a fix PR from UI, CLI wizard
- ✓ Upgrade - Automatically calculates the minimal direct dependency version upgrade needed
- ✓ Precision patch - Use patches backported by Snyk security team to fix when direct upgrade is not available or it'll take time to have upgrade implemented
- ✓ Automatic fix for new vulnerabilities - Automatically generate fix pull requests for newly discovered vulnerabilities

# SECURE YOUR DEPENDENCY GRAPH

*Setup dependency monitoring for all your projects*

*Patch your software, both continuously and urgently*

*Focus on the dependencies that matter*

# EMPOWER PEOPLE TO TAKE SECURITY SERIOUSLY

# IN-DEPTH ONLINE COURSES TO HELP YOU TAKE SECURITY SERIOUSLY
